

Week1 web very easy web_wp

首先分析代码

```
<?php
error_reporting(0);
include("flag.php");

if(strpos("vidar", $_GET['id']) !== FALSE)
    die("<p>干巴爹</p>");

$_GET['id'] = urldecode($_GET['id']);
if($_GET['id'] === "vidar")
{
    echo $flag;
}
highlight_file(__FILE__);
?>
```

如果 id 中出现 vidar 会显示干巴爹

但是 id 要在经过 url 转化能够转换成 vidar,

所以用 HTML URL 编码尝试绕过。

%25 对应%，将 d 转换成%2564 得到 flag

The screenshot shows a web browser window with the address bar displaying the URL: 120.78.184.111:8080/week1/very_ez/index.php?id=vi%2564a. Below the address bar, there are search engines (Bing, Baidu) and a list of bookmarks. The main content area displays the source code of the web page, which is the same PHP code as shown in the previous block. The code is highlighted in a dark background with syntax coloring.

```
hgame{urlDecode_Is_GoOd} <?php
error_reporting(0);
include("flag.php");

if(strpos("vidar", $_GET['id']) !== FALSE)
    die("<p>干巴爹</p>");

$_GET['id'] = urldecode($_GET['id']);
if($_GET['id'] === "vidar")
{
    echo $flag;
}
highlight_file(__FILE__);
?>
```
